## MODULE LIST

### 1.1 Graded quasimodular forms ring

Let  $E_2$  be the weight 2 Eisenstein series defined by

$$E_2(z) = 1 - \frac{2k}{B_k} \sum_{n=1}^{\infty} \sigma(n)q^n$$

where  $\sigma$  is the sum of divisors function and  $q = \exp(2\pi iz)$  is the classical parameter at infinity, with  $\text{im}(z) > 0$ . This weight 2 Eisenstein series is not a modular form as it does not satisfy the modularity condition:

$$z^2 E_2(-1/z) = E_2(z) + \frac{2k}{4\pi i B_k z}.$$

$E_2$  is a quasimodular form of weight 2. General quasimodular forms of given weight can also be defined. We denote by  $QM$  the graded ring of quasimodular forms for the full modular group  $SL_2(\mathbf{Z})$ .

The SageMath implementation of the graded ring of quasimodular forms uses the following isomorphism:

$$QM \cong M_*[E_2]$$

where  $M_* \cong \mathbf{C}[E_4, E_6]$  is the graded ring of modular forms for  $SL_2(\mathbf{Z})$ . (see `sage.modular.modform.ring.ModularFormsRing`).

More generally, if  $\Gamma \leq SL_2(\mathbf{Z})$  is a congruence subgroup, then the graded ring of quasimodular forms for  $\Gamma$  is given by  $M_*(\Gamma)[E_2]$  where  $M_*(\Gamma)$  is the ring of modular forms for  $\Gamma$ .

The SageMath implementation of the graded quasimodular forms ring allows computation of a set of generators and perform usual arithmetic operations.

EXAMPLES:

```
sage: QM = QuasiModularForms(1); QM
Ring of Quasimodular Forms for Modular Group SL(2,Z) over Rational Field
sage: QM.gens()
[1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6),
 1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + O(q^6),
 1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + O(q^6)]
sage: E2 = QM.0; E4 = QM.1; E6 = QM.2
sage: E2 * E4 + E6
2 - 288*q - 20304*q^2 - 185472*q^3 - 855216*q^4 - 2697408*q^5 + O(q^6)
sage: E2.parent()
Ring of Quasimodular Forms for Modular Group SL(2,Z) over Rational Field
```

The `polygen` method also return the weight-2 Eisenstein series as a polynomial variable over the ring of modular forms:

```
sage: QM = QuasiModularForms(1)
sage: E2 = QM.polygen(); E2
E2
sage: E2.parent()
Univariate Polynomial Ring in E2 over Ring of Modular Forms for Modular Group SL(2,Z)
↳over Rational Field
```

An element of a ring of quasimodular forms can be created via a list of modular forms or graded modular forms. The  $i$ -th index of the list will correspond to the  $i$ -th coefficient of the polynomial in  $E_2$ :

```
sage: QM = QuasiModularForms(1)
sage: E2 = QM.0
sage: Delta = CuspForms(1, 12).0
sage: E4 = ModularForms(1, 4).0
sage: F = QM([Delta, E4, Delta + E4]); F
2 + 410*q - 12696*q^2 - 50424*q^3 + 1076264*q^4 + 10431996*q^5 + O(q^6)
sage: F == Delta + E4 * E2 + (Delta + E4) * E2^2
True
```

**Note:**

- Currently, the only supported base ring is the Rational Field;
- Spaces of quasimodular forms of fixed weight are not yet implemented.

REFERENCE:

See section 5.3 (page 58) of [Zag2008]

AUTHORS:

- David Ayotte (2021-03-18): initial version

**class** `sage.modular.quasimodform.ring.QuasiModularForms`(*group=1, base\_ring=Rational Field, name='E2'*)

Bases: `sage.structure.parent.Parent`, `sage.structure.unique_representation.UniqueRepresentation`

The graded ring of quasimodular forms for the full modular group  $SL_2(\mathbf{Z})$ , with coefficients in a ring.

EXAMPLES:

```
sage: QM = QuasiModularForms(1); QM
Ring of Quasimodular Forms for Modular Group SL(2,Z) over Rational Field
sage: QM.gens()
[1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6),
 1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + O(q^6),
 1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + O(q^6)]
```

It is possible to access the weight 2 Eisenstein series:

```
sage: QM.weight_2_eisenstein_series()
1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6)
```

Currently, the only supported base ring is the rational numbers:

```
sage: QuasiModularForms(1, GF(5))
Traceback (most recent call last):
...
NotImplementedError: base ring other than Q are not yet supported for quasimodular_
↳forms ring
```

**Element**

alias of `sage.modular.quasimodform.element.QuasiModularFormsElement`

**from\_polynomial**(*polynomial*)

Convert the given polynomial  $P(X, Y, Z)$  to the graded quasiform  $P(E_2, E_4, E_6)$  where  $E_2, E_4$  and  $E_6$  are the generators given by `gens()`.

INPUT:

- `polynomial` – A multivariate polynomial

OUTPUT: the graded quasimodular forms  $P(E_2, E_4, E_6)$

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: P.<x, y, z> = QQ[]
sage: QM.from_polynomial(x)
1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6)
sage: QM.from_polynomial(x) == QM.0
True
sage: QM.from_polynomial(y) == QM.1
True
sage: QM.from_polynomial(z) == QM.2
True
sage: QM.from_polynomial(x^2 + y + x*z + 1)
4 - 336*q - 2016*q^2 + 322368*q^3 + 3691392*q^4 + 21797280*q^5 + O(q^6)
```

**gen**(*n*)

Return the  $n$ -th generator of the quasimodular forms ring.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: QM.0
1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6)
sage: QM.1
1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + O(q^6)
sage: QM.2
1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + O(q^6)
sage: QM = QuasiModularForms(5)
sage: QM.0
1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6)
sage: QM.1
1 + 6*q + 18*q^2 + 24*q^3 + 42*q^4 + 6*q^5 + O(q^6)
sage: QM.2
1 + 240*q^5 + O(q^6)
sage: QM.3
q + 10*q^3 + 28*q^4 + 35*q^5 + O(q^6)
```

(continues on next page)

(continued from previous page)

```
sage: QM.4
Traceback (most recent call last):
...
IndexError: list index out of range
```

**generators()**

Return a list of generators of the quasimodular forms ring.

Note that the generators of the modular forms subring are the one given by the method `sage.modular.modform.ring.ModularFormsRing.gen_forms()`

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: QM.gens()
[1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + 0(q^6),
 1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + 0(q^6),
 1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + 0(q^6)]
sage: QM.modular_forms_subring().gen_forms()
[1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + 0(q^6),
 1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + 0(q^6)]
sage: QM = QuasiModularForms(5)
sage: QM.gens()
[1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + 0(q^6),
 1 + 6*q + 18*q^2 + 24*q^3 + 42*q^4 + 6*q^5 + 0(q^6),
 1 + 240*q^5 + 0(q^6),
 q + 10*q^3 + 28*q^4 + 35*q^5 + 0(q^6)]
```

An alias of this method is `generators`:

```
sage: QuasiModularForms(1).generators()
[1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + 0(q^6),
 1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + 0(q^6),
 1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + 0(q^6)]
```

**gens()**

Return a list of generators of the quasimodular forms ring.

Note that the generators of the modular forms subring are the one given by the method `sage.modular.modform.ring.ModularFormsRing.gen_forms()`

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: QM.gens()
[1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + 0(q^6),
 1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + 0(q^6),
 1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + 0(q^6)]
sage: QM.modular_forms_subring().gen_forms()
[1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + 0(q^6),
 1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + 0(q^6)]
sage: QM = QuasiModularForms(5)
sage: QM.gens()
[1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + 0(q^6),
 1 + 6*q + 18*q^2 + 24*q^3 + 42*q^4 + 6*q^5 + 0(q^6),
```

(continues on next page)

(continued from previous page)

```
1 + 240*q^5 + O(q^6),
q + 10*q^3 + 28*q^4 + 35*q^5 + O(q^6)]
```

An alias of this method is `generators`:

```
sage: QuasiModularForms(1).generators()
[1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6),
1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + O(q^6),
1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + O(q^6)]
```

### `group()`

Return the congruence subgroup attached to the given quasimodular forms ring.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: QM.group()
Modular Group SL(2,Z)
sage: QM.group() is SL2Z
True
sage: QuasiModularForms(3).group()
Congruence Subgroup Gamma0(3)
sage: QuasiModularForms(Gamma1(5)).group()
Congruence Subgroup Gamma1(5)
```

### `modular_forms_of_weight(weight)`

Return the space of modular forms on this group of the given weight.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: QM.modular_forms_of_weight(12)
Modular Forms space of dimension 2 for Modular Group SL(2,Z) of weight 12 over
↳Rational Field
sage: QM = QuasiModularForms(Gamma1(3))
sage: QM.modular_forms_of_weight(4)
Modular Forms space of dimension 2 for Congruence Subgroup Gamma1(3) of weight
↳4 over Rational Field
```

### `modular_forms_subring()`

Return the subring of modular forms of this ring of quasimodular forms.

EXAMPLES:

```
sage: QuasiModularForms(1).modular_forms_subring()
Ring of Modular Forms for Modular Group SL(2,Z) over Rational Field
sage: QuasiModularForms(5).modular_forms_subring()
Ring of Modular Forms for Congruence Subgroup Gamma0(5) over Rational Field
```

### `ngens()`

Return the number of generators of the given graded quasimodular forms ring.

EXAMPLES:

```
sage: QuasiModularForms(1).ngens()
3
```

**one()**

Return the one element of this ring.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: QM.one()
1
sage: QM.one().is_one()
True
```

**polygen()**

Return the generator of this quasimodular form space as a polynomial ring over the modular form subring.

Note that this generator correspond to the weight-2 Eisenstein series. The default name of this generator is E2.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: QM.polygen()
E2
sage: QuasiModularForms(1, name='X').polygen()
X
sage: QM.polygen().parent()
Univariate Polynomial Ring in E2 over Ring of Modular Forms for Modular Group
↪ SL(2,Z) over Rational Field
```

**polynomial\_ring(names='E2, E4, E6')**

Return a multivariate polynomial ring isomorphic to the given graded quasimodular forms ring.

In the case of the full modular group, this ring is  $R[E_2, E_4, E_6]$  where  $E_2$ ,  $E_4$  and  $E_6$  have degrees 2, 4 and 6 respectively.

INPUT:

- names (str, default: 'E2, E4, E6') – a list or tuple of names (strings), or a comma separated string. Correspond to the names of the variables.

OUTPUT: A multivariate polynomial ring in the variables names

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: P.<E2, E4, E6> = QM.polynomial_ring(); P
Multivariate Polynomial Ring in E2, E4, E6 over Rational Field
sage: E2.degree()
2
sage: E4.degree()
4
sage: E6.degree()
6
sage: P.<x, y, z, w> = QQ[]
sage: QM.from_polynomial(x+y+z+w)
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
ValueError: the number of variables (4) of the given polynomial cannot exceed
↳ the number of generators (3) of the quasimodular forms ring
```

**quasimodular\_forms\_of\_weight(*weight*)**

Return the space of quasimodular forms on this group of the given weight.

INPUT:

- *weight* (int, Integer)

OUTPUT: A quasimodular forms space of the given weight.

EXAMPLES:

```
sage: QuasiModularForms(1).quasimodular_forms_of_weight(4)
Traceback (most recent call last):
...
NotImplementedError: spaces of quasimodular forms of fixed weight not yet
↳ implemented
```

**some\_elements()**

Return a list of generators of self.

EXAMPLES:

```
sage: QuasiModularForms(1).some_elements()
[1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6),
 1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + O(q^6),
 1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + O(q^6)]
```

**weight\_2\_eisenstein\_series()**

Return the weight 2 Eisenstein series.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: E2 = QM.weight_2_eisenstein_series(); E2
1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6)
sage: E2.parent()
Ring of Quasimodular Forms for Modular Group SL(2,Z) over Rational Field
```

**zero()**

Return the zero element of this ring.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: QM.zero()
0
sage: QM.zero().is_zero()
True
```

## 1.2 Elements of quasimodular forms rings

AUTHORS:

- DAVID AYOTTE (2021-03-18): initial version

**class** sage.modular.quasimodform.element.QuasiModularFormsElement(*parent, polynomial*)

Bases: sage.structure.element.ModuleElement

A quasimodular forms ring element. Such an element is described by SageMath as a polynomial

$$f_0 + f_1E_2 + f_2E_2^2 + \cdots + f_mE_2^m$$

where each  $f_i$  a graded modular form element (see GradedModularFormElement)

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: QM.gens()
[1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6),
 1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + O(q^6),
 1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + O(q^6)]
sage: QM.0 + QM.1
2 + 216*q + 2088*q^2 + 6624*q^3 + 17352*q^4 + 30096*q^5 + O(q^6)
sage: QM.0 * QM.1
1 + 216*q - 3672*q^2 - 62496*q^3 - 322488*q^4 - 1121904*q^5 + O(q^6)
sage: (QM.0)^2
1 - 48*q + 432*q^2 + 3264*q^3 + 9456*q^4 + 21600*q^5 + O(q^6)
sage: QM.0 == QM.1
False
```

Quasimodular forms ring element can be created via a polynomial in  $E_2$  over the ring of modular forms:

```
sage: E2 = QM.polygen()
sage: E2.parent()
Univariate Polynomial Ring in E2 over Ring of Modular Forms for Modular Group SL(2,
↔Z) over Rational Field
sage: QM(E2)
1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6)
sage: M = QM.modular_forms_subring()
sage: QM(M.0 * E2 + M.1 * E2^2)
2 - 336*q + 4320*q^2 + 398400*q^3 - 3772992*q^4 - 89283168*q^5 + O(q^6)
```

**derivative()**

Return the derivative  $q \frac{d}{dq}$  of the given quasimodular form.

If the form is not homogeneous, then this method sums the derivative of each homogeneous component.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: E2, E4, E6 = QM.gens()
sage: dE2 = E2.derivative(); dE2
-24*q - 144*q^2 - 288*q^3 - 672*q^4 - 720*q^5 + O(q^6)
sage: dE2 == (E2^2 - E4)/12 # Ramanujan identity
True
```

(continues on next page)

(continued from previous page)

```
sage: dE4 = E4.derivative(); dE4
240*q + 4320*q^2 + 20160*q^3 + 70080*q^4 + 151200*q^5 + O(q^6)
sage: dE4 == (E2 * E4 - E6)/3 # Ramanujan identity
True
sage: dE6 = E6.derivative(); dE6
-504*q - 33264*q^2 - 368928*q^3 - 2130912*q^4 - 7877520*q^5 + O(q^6)
sage: dE6 == (E2 * E6 - E4^2)/2 # Ramanujan identity
True
```

Note that the derivative of a modular form is not necessarily a modular form:

```
sage: dE4.is_modular_form()
False
sage: dE4.weight()
6
```

**homogeneous\_components()**

Return a dictionary where the values are the homogeneous components of the given graded form and the keys are the weights of those components.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: (QM.0).homogeneous_components()
{2: 1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6)}
sage: (QM.0 + QM.1 + QM.2).homogeneous_components()
{2: 1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6),
4: 1 + 240*q + 2160*q^2 + 6720*q^3 + 17520*q^4 + 30240*q^5 + O(q^6),
6: 1 - 504*q - 16632*q^2 - 122976*q^3 - 532728*q^4 - 1575504*q^5 + O(q^6)}
sage: (1 + QM.0).homogeneous_components()
{0: 1, 2: 1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6)}
```

**is\_graded\_modular\_form()**

Return whether the given quasimodular form is a graded modular form element (see [GradedModularFormElement](#)).

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: (QM.0).is_graded_modular_form()
False
sage: (QM.1).is_graded_modular_form()
True
sage: (QM.1 + QM.0^2).is_graded_modular_form()
False
sage: (QM.1^2 + QM.2).is_graded_modular_form()
True
sage: QM = QuasiModularForms(Gamma0(6))
sage: (QM.0).is_graded_modular_form()
False
sage: (QM.1 + QM.2 + QM.1 * QM.3).is_graded_modular_form()
True
sage: QM.zero().is_graded_modular_form()
True
```

**Note:** A graded modular form in SageMath is not necessarily a modular form as it can have mixed weight components. To check for modular forms only, see the method `is_modular_form()`.

---

**is\_homogeneous()**

Return whether the graded quasimodular form is a homogeneous element, that is, it lives in a unique graded components of the parent of `self`.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: (QM.0).is_homogeneous()
True
sage: (QM.0 + QM.1).is_homogeneous()
False
sage: (QM.0 * QM.1 + QM.2).is_homogeneous()
True
sage: QM(1).is_homogeneous()
True
sage: (1 + QM.0).is_homogeneous()
False
```

**is\_modular\_form()**

Return whether the given quasimodular form is a modular form.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: (QM.0).is_modular_form()
False
sage: (QM.1).is_modular_form()
True
sage: (QM.1 + QM.2).is_modular_form() # mixed weight components
False
sage: QM.zero().is_modular_form()
True
```

**is\_one()**

Return whether the given quasimodular form is 1, i.e. the multiplicative identity.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: QM.one().is_one()
True
sage: QM(1).is_one()
True
sage: (QM.0).is_one()
False
```

**is\_zero()**

Return whether the given quasimodular form is zero.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: QM.zero().is_zero()
True
sage: QM(0).is_zero()
True
sage: QM(1/2).is_zero()
False
sage: (QM.0).is_zero()
False
```

**polynomial**(names='E2, E4, E6')

Return a multivariate polynomial  $P(E_2, E_4, E_6)$  corresponding to the given form where  $E_2$ ,  $E_4$  and  $E_6$  are the generators of the quasimodular form ring given by the following method: `gens()`.

INPUT:

- names (str, default: 'E2, E4, E6') – a list or tuple of names (strings), or a comma separated string. Correspond to the names of the variables;

OUTPUT: A multivariate polynomial in the variables names

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: (QM.0 + QM.1).polynomial()
E4 + E2
sage: (1/2 + QM.0 + 2*QM.1^2 + QM.0*QM.2).polynomial()
E2*E6 + 2*E4^2 + E2 + 1/2
```

**q\_expansion**(prec=6)

Return the  $q$ -expansion of the given quasimodular form up to precision prec (default: 6).

An alias of this method is `qexp`.

EXAMPLES:

```
sage: QM = QuasiModularForms()
sage: E2 = QM.0
sage: E2.q_expansion()
1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6)
sage: E2.q_expansion(prec=10)
1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 - 288*q^6 - 192*q^7 - 360*q^8 -
↪312*q^9 + O(q^10)
```

**qexp**(prec=6)

Return the  $q$ -expansion of the given quasimodular form up to precision prec (default: 6).

An alias of this method is `qexp`.

EXAMPLES:

```
sage: QM = QuasiModularForms()
sage: E2 = QM.0
sage: E2.q_expansion()
1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 + O(q^6)
sage: E2.q_expansion(prec=10)
1 - 24*q - 72*q^2 - 96*q^3 - 168*q^4 - 144*q^5 - 288*q^6 - 192*q^7 - 360*q^8 -
↪312*q^9 + O(q^10)
```

**serre\_derivative()**

Return the Serre derivative of the given quasimodular form.

If the form is not homogeneous, then this method sums the Serre derivative of each homogeneous component.

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: E2, E4, E6 = QM.gens()
sage: DE2 = E2.serre_derivative(); DE2
-1/6 - 16*q - 216*q^2 - 832*q^3 - 2248*q^4 - 4320*q^5 + O(q^6)
sage: DE2 == (-E2^2 - E4)/12
True
sage: DE4 = E4.serre_derivative(); DE4
-1/3 + 168*q + 5544*q^2 + 40992*q^3 + 177576*q^4 + 525168*q^5 + O(q^6)
sage: DE4 == (-1/3) * E6
True
sage: DE6 = E6.serre_derivative(); DE6
-1/2 - 240*q - 30960*q^2 - 525120*q^3 - 3963120*q^4 - 18750240*q^5 + O(q^6)
sage: DE6 == (-1/2) * E4^2
True
```

The Serre derivative raises the weight of homogeneous elements by 2:

```
sage: F = E6 + E4 * E2
sage: F.weight()
6
sage: F.serre_derivative().weight()
8
```

**to\_polynomial(names='E2, E4, E6')**

Return a multivariate polynomial  $P(E_2, E_4, E_6)$  corresponding to the given form where  $E_2$ ,  $E_4$  and  $E_6$  are the generators of the quasimodular form ring given by the following method: [gens\(\)](#).

INPUT:

- **names** (str, default: 'E2, E4, E6') – a list or tuple of names (strings), or a comma separated string. Correspond to the names of the variables;

OUTPUT: A multivariate polynomial in the variables **names**

EXAMPLES:

```
sage: QM = QuasiModularForms(1)
sage: (QM.0 + QM.1).polynomial()
E4 + E2
sage: (1/2 + QM.0 + 2*QM.1^2 + QM.0*QM.2).polynomial()
E2*E6 + 2*E4^2 + E2 + 1/2
```

**weight()**

Return the weight of the given quasimodular form.

Note that the given form must be homogeneous.

EXAMPLES:

```

sage: QM = QuasiModularForms(1)
sage: (QM.0).weight()
2
sage: (QM.0 * QM.1 + QM.2).weight()
6
sage: QM(1/2).weight()
0
sage: (QM.0 + QM.1).weight()
Traceback (most recent call last):
...
ValueError: the given graded quasiform is not an homogeneous element

```

**weights\_list()**

Return the list of the weights of all the graded components of the given graded quasimodular form.

EXAMPLES:

```

sage: QM = QuasiModularForms(1)
sage: (QM.0).weights_list()
[2]
sage: (QM.0 + QM.1 + QM.2).weights_list()
[2, 4, 6]
sage: (QM.0 * QM.1 + QM.2).weights_list()
[6]
sage: QM(1/2).weights_list()
[0]

```
